Storage Technology Corporation

Storage Technology Corporation (STC) was established in 1969 by four former IBM engineers and has grown into a billion dollar corporation. It is currently ranked number 11 on Datamation's list of the top 100 companies in the field and is expected by some analysts to be the third largest computer company in the country by 1990. The company is based in Denver and employs about 16,000 people.

STC's primary product has been computer disc drives and it is currently the largest manufacturer of disc drives in the world. It also produces computer printers, computer memories, and solid state disc drives and plans to market its own computer in 1984. STC plans to begin marketing its optical discs later this year; the company feels that it is on the leading edge of this technology, or close to it.

STC's headquarters people are available to come here during the week of 7 February, the date and time are up to you. If that time frame is not convenient, I am sure that we could reschedule the meeting for later. STC is planning to have the product manager, Mike Deese, and the software integration manager make the presentation. They will need about one and one-half hours for their presentation, but can tailor it to meet our needs.
